

A Fully Agentic Advertising Exchange Stack for Buyers and Sellers

- Built on Arc/Circle using Google Gemini

What is VDX?

- A Simplification of Buying and Selling Ads
- A way to empower all advertisers and publishers to compete on the Open Exchange at the same level no matter how big or small
- A collapse of the traditional model of the Programmatic Advertising Exchange
 - Made possible with Advanced AI automation and Circle Nanopayments
- A path to the freedom, choice, and accessibility promised by the original Internet

What makes VDX different?

1. We unify the Ad stack for both Buy and Sell Side
2. We execute sub-cent settlement in Real-Time with no Gas Fees
3. With Automation we enable even basic users to access the same RTB auction pricing/scale for digital ads as major Advertisers and Publishers.

Buying and Selling Agents

Buying Agent:

- Replaces a DSP
- 1 Wallet per agent prefunded to spend
- Comes to the Exchange alongside other Buying Agents and competes in an Auction to purchase Ad Space (Impressions) based on preset parameters like Bid (min/Max), Budget/Pacing, Ad (Type, format, size), context targeting
- If Parameters are met on Exchange by a Selling Agent a bid (Sub-cent) is placed

Selling Agent:

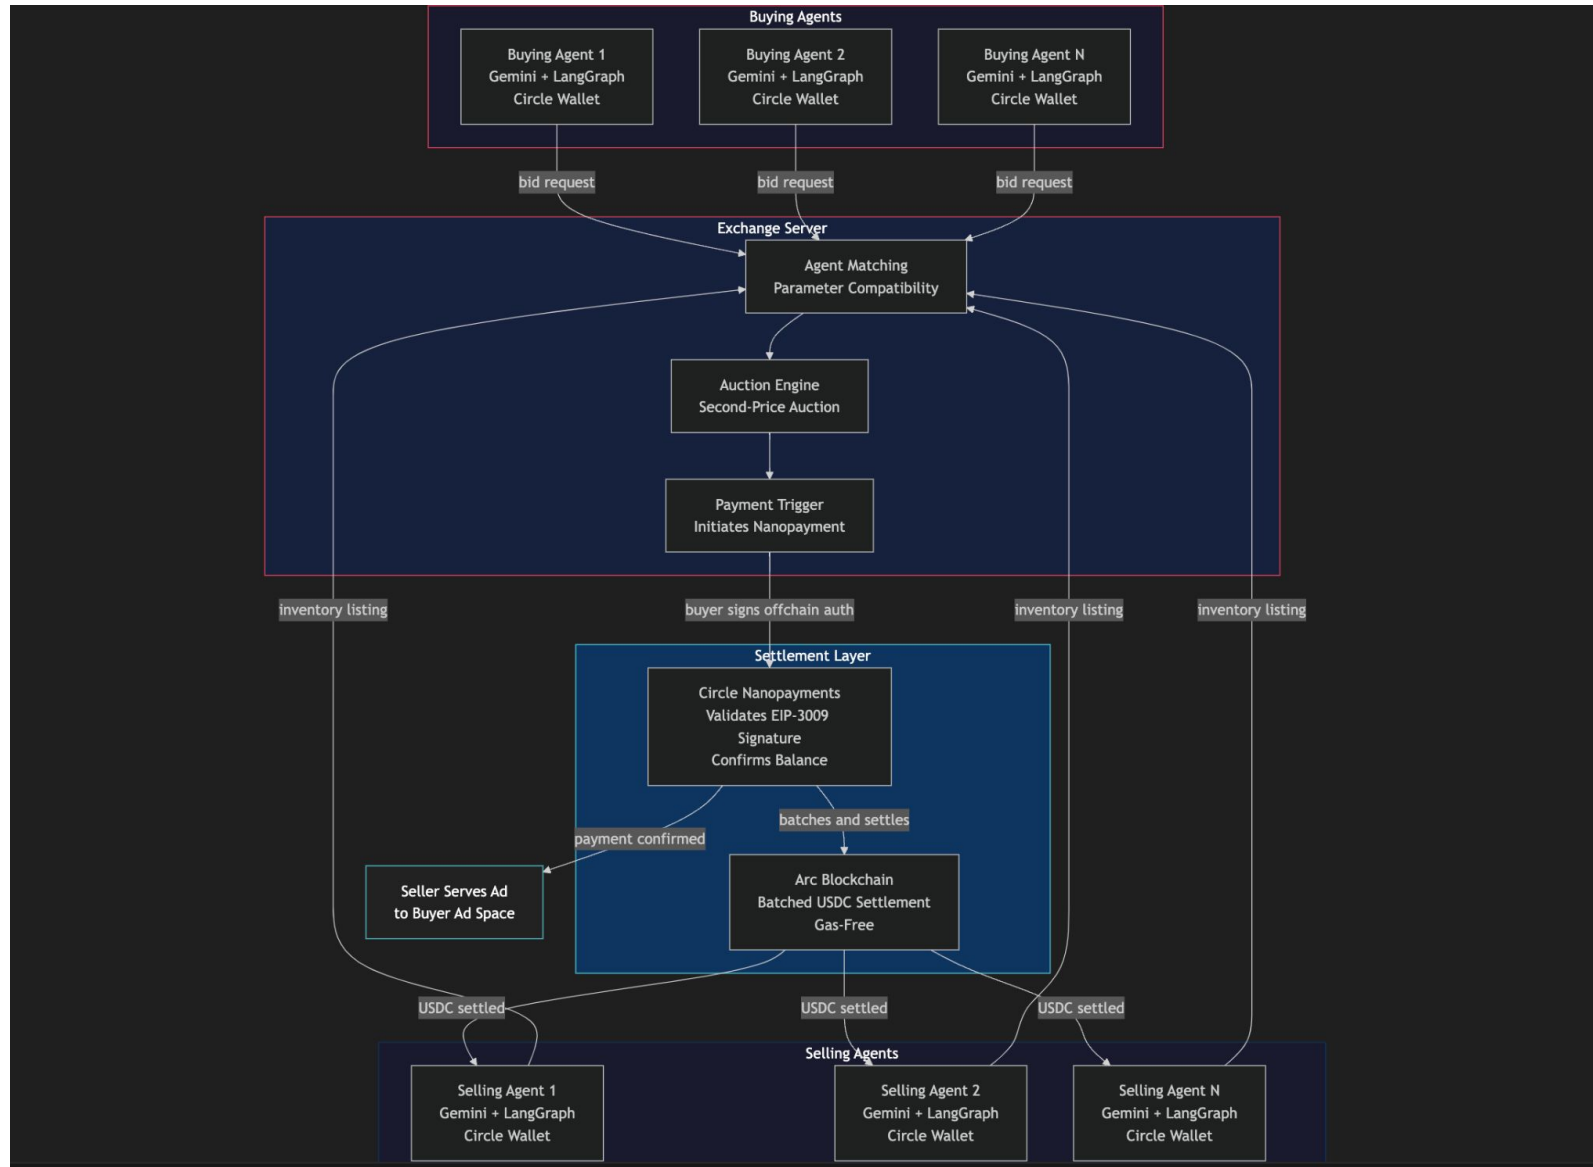

- Replaces SSP
- 1 Wallet per agent to accept payment serving ads
- Brings Ad space (impressions) to the Exchange to sell to the highest bidder based on limited parameters like Ad (type, format, size), contextual exclusions, etc.
- If Parameters are met on Exchange by one or many buying agents sell ad space (Impressions) for winning Bid (sub cent) and serve hosted ad to user/viewer in real time.

The Exchange

- Marries Buyer and seller agents in most efficient configuration maximizing Auction value
- Uses First past the post auction dynamics
 - Highest bid wins the auction at the 2nd highest bid + \$0.01 (or less)

Creates smart contract after winning bid is accepted by seller agent, ad is served then payment will be settled in the settlement layer.

VDX System
Architecture V1

Settlement Layer

- Once the Exchange has married buyers with compatible sellers and an action has taken place, and an ad is served, the seller sends verification automatically and the payment is then settled...
